Important considerations when choosing a Neurofeedback Provider:

Would you see a physician who is not Board Certified in their area of practice? The answer of course is NO.

The Association for Applied Psychophysiology (AAPB) and the Biofeedback Certification International Alliance (BCIA) strongly caution against entering treatment with a provider who is NOT Board Certified by BCIA. BCIA is the only certifying body in Neurofeedback. Attending a training course is not a certification. This is your first step to determine whether a provider has the credentials and experience necessary to competently perform Neurofeedback.

The next step is whether they use a 19 channel quantitative EEG to develop an individualized treatment program. A brain map with less than 19 channels is NOT a quantitative EEG. The clinician should perform and interpret this, not send it out to a second party.

Finally, neurofeedback should be done with a full cap of 19 placements. Anything less does not adequately address the issues and often results in a greater length of sessions and/or lack of results. This is critical with more complex cases such as Traumatic Brain Injury and Autism.
